

# Stonebond®

## resin bonded surfacing

Stonebond® is a hard-wearing, easy-to-use, cold-applied, polyurethane (PU) resin surface dressing used for bonding specially selected aggregates to macadam, asphalt, concrete, metal or timber surfaces.

The finished Stonebond® surface gives the appearance of shingle but without the nuisance and maintenance problems associated with loose aggregates. The cured Stonebond® system gives a durable, textured surfacing, which is ideal for pedestrian areas, pathways, cycleways, car parks, traffic calming, colour demarcation and anti-skid applications.

### Typical uses and applications

Stonebond® can be used with a wide range of both natural and pigmented aggregates for both decorative & slip-resistant dressings. It can be applied to new construction or to existing surfaces. Stonebond® is a thermosetting resin, it will not yield under hot conditions or heavy use, maintaining an integrated stone surface.

### Colours

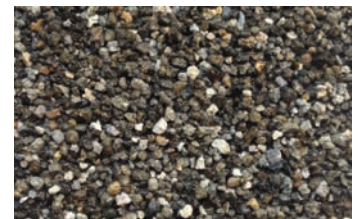

A wide range of natural aggregates are available including Golden Pea, Corn Flint, Amber Flint, Red, Green or Grey Granite. Other pigmented versions can also be supplied to meet specific project requirements. The resin is available in natural and pigmented colours to give added enhancement to the aggregate.
